Spatial Cognition

Occlusion Order

Identify repeated objects across views and remove all objects in order from a specified starting object.

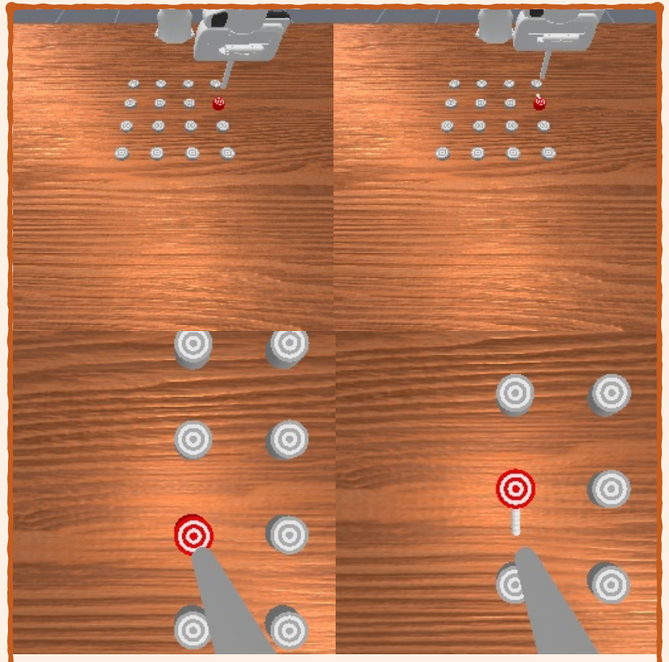

Mirror Distinction

Distinguish real objects from reflections and remove them.

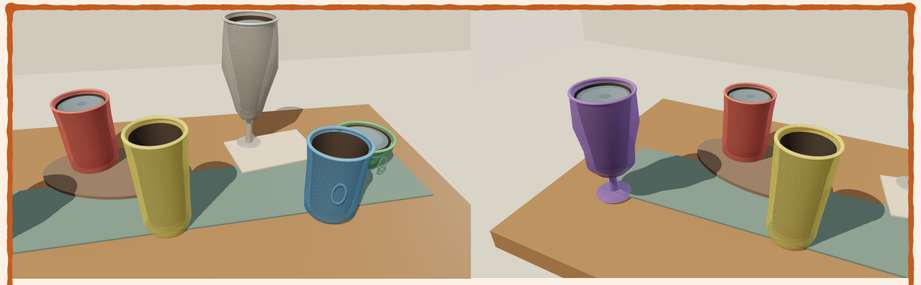

Target Discovery

Locate the target under reflection and select the correct route.

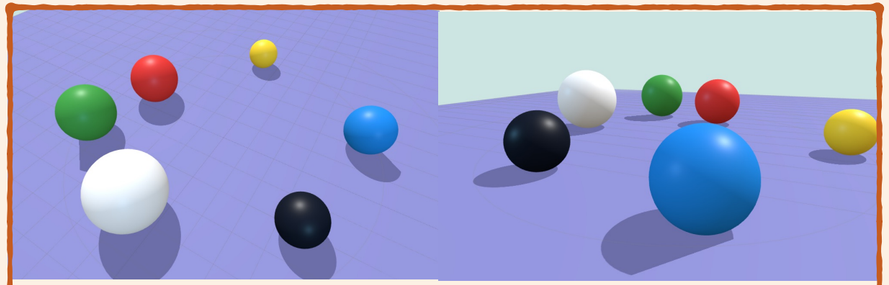

Action Recovery

Use the continuous action sequence from one view to reorder corresponding observations from another view.

State Recognition

Integrate information across multiple views to determine the states of objects in the scene.

Spatial Relations

Identify and extract useful information under misleading spatial cues such as perspective-induced size differences.
