Integrated Observation

Occlusion Order(#50)

Identify repeated objects across views and remove all objects in order from a specified starting object.

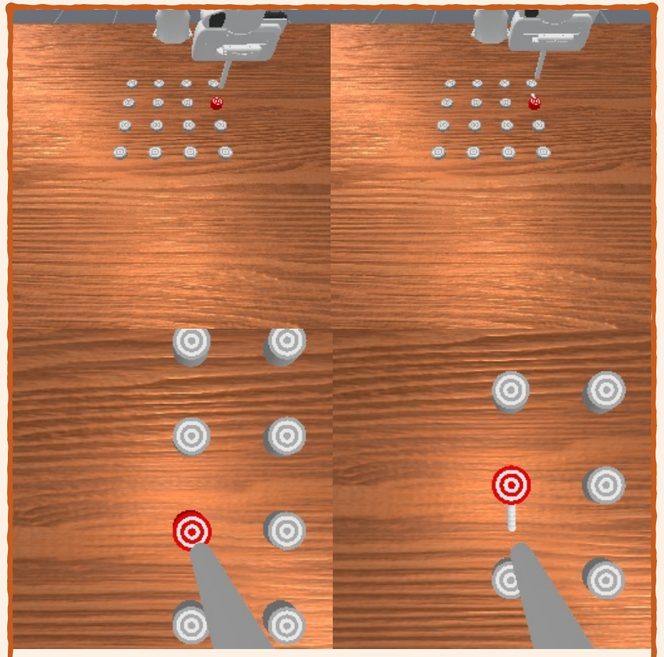

Mirror Distinction(#35)

Distinguish real objects from reflections and remove them.

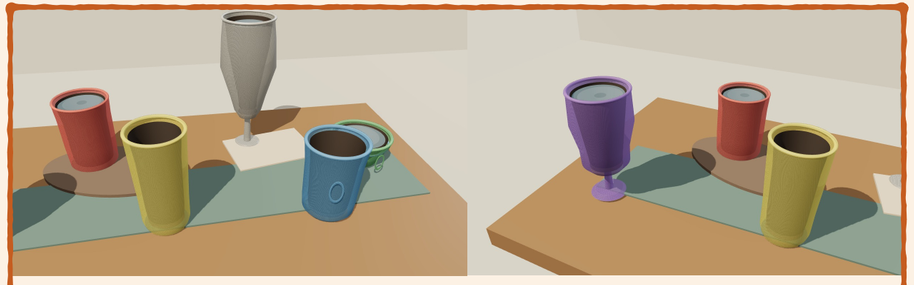

Target Discovery(#40)

Locate the target under reflection and select the correct route.

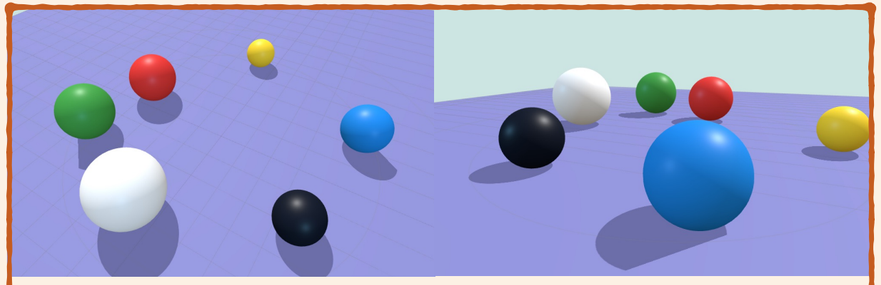

Action Recovery(#50)

Use the continuous action sequence from one view to reorder corresponding observations from another view.

State Recognition(#40)

Integrate information across multiple views to determine the states of objects in the scene.

Spatial Relations(#44)

Identify and extract useful information under misleading spatial cues such as perspective-induced size differences.
