Temporal Reasoning

Progress Tracking

Match the image sequence to the given step list, ignore irrelevant actions, and determine the current valid progress in the list.

Temporal Ordering

Reorder shuffled images into the correct temporal sequence based on their temporal relationships.

Persistent Counting

Count the target objects across temporal images while identifying repeated appearances of the same object to avoid double counting.

Instruction Alignment

Reorder shuffled route images according to navigation instructions.

Motion Retrieval

Identify and locate the target object performing the specified action from a temporal image sequence.
